Double Balanced Weave Belts (DB)

Correct conveyor belt measurement is vital for businesses that need repairs, replacements, or to match an existing belt.

Conveyor Belt Measuring Tool for Double Balanced Weave Belts

Below, we have provided the conveyor belt measurement formula and diagrams needed specifically to measure double-balanced weave belts.

Formula Example: DB-24-12-8/10

Step 1:

Determine mesh width and length needed.

Step 2:

Measure the spirals across the width in 12" increments. (24) See A in the diagram.

Measure the spirals down the length in 12" increments. (12) See B in the diagram.

Step 3:

Measure the connecting rod wire diameter. (.162") See C in the diagram.

Measure the spiral wire diameter. (.135") See D in the diagram.

Step 4:

Match the decimal sizes in inches to their corresponding wire gauge equivalents. (8 & 10) See table E.

Step 5:

Determine/provide mesh material. [View our material chart on our website.](#)
